CLAIMS:

- √ 1. Conditional access system for controlling the access of receivers of end-users to data transmitted from a data content source in an uplink system, said uplink system comprising a scrambler for scrambling the content supplied from the content source, an entitlement control message generator for generating entitlement control messages containing a control word and an entitlement identification, and a transmitter for transmitting the scrambled content and the entitlement control messages, in which access system a descrambler, an entitlement control message decoder and means for storing entitlements are associated to the receiver, and in which access system if a match between the entitlement identification in the entitlement control message and the entitlement of the end-user exists, the entitlement control message decoder supplies a control word to the descrambler for descrambling a part of the received scrambled content for which the receiver is entitled, characterized in that the receiver side is provided with means for receiving and storing a meta-entitlement of the end-user, said metaentitlement including an event number range, and means for extracting from the metaentitlement an actual entitlement identification including the event selected by the end-user, after which a control word from the entitlement control message is supplied to the descrambler if the entitlement identification in the entitlement control message matches the actual entitlement.
- Conditional access system according to claim 1, in which the uplink system
 comprises a generator and transmitter for generating and transmitting an entitlement management message, characterized in that the meta-entitlement is transmitted in an entitlement management message to the entitled receiver.
- 3. Conditional access system according to claim 1, characterized in that the actual entitlement is extracted from both the meta-entitlement and the entitlement control message.
 - 4. Conditional access system according to claim 1, characterized in that the metaentitlement includes a date range.

- 5. Conditional access system according to claim 1, characterized in that the metaentitlement includes a number of allowed selections.
- 6. Conditional access system according to claim 5, characterized in that at the receiver side a selection counter is provided, which is set to the number of allowed selections in the meta-entitlement in the entitlement management message upon reception of said message and is decremented by each event selection by the end-user.
 - 7. Uplink system suitable for a conditional access system according to claim 1, comprising a scrambler for scrambling the content supplied from the content source, an entitlement control message generator for generating entitlement control messages containing a control word and an entitlement identification, and a transmitter for transmitting the scrambled content and the entitlement control messages, wherein an event number generator is connected to the entitlement control message generator.
 - 8. Receiver suitable for a conditional access system according to claim 1, comprising a descrambler, an entitlement control message decoder and means for storing entitlements, wherein means are provided for receiving and storing a meta-entitlement of the end-user, said meta-entitlement including an event number range, and further means for extracting from the meta-entitlement an actual entitlement identification including the event selected by the end-user, after which a control word from the entitlement control message is supplied to the descrambler if the entitlement identification in the entitlement control message matches the actual entitlement.
